

The Omni-Object

A Multiscalar Warm-Up

A top-secret research project developed by a team of physicists from the Federal University of Astana have detected a curious "knot" in the spacetime structure of the universe. The result is a bounded topological space (i.e. a thing) that contains, deceptively, the **entirety of the known universe.**

They call this: the "Omni-Object"*.

** Omniojectus universalis*

The Omni-Object

A Multiscalar Warm-Up

Using finely tuned gravitational sensors, they have triangulated the location of the Omni-Object to within fifteen centimeters of your current IP address. It's *in your room!*

As ever, uncertainty abides. The scientists' best efforts have failed to verify their theory. The only "device" that can confirm the Omni-Object's presence (or bring it into existence?) is, you guessed it: a durational practice of **COMPLETE** human attention.

YOUR MISSION:

Attend to your Omni-Object

deceptive in scale; infinite in complexity
